Vector spaces, subspaces & basis

A vector space (V,F, +, .)

- **F** a field
- V a set (of objects called vectors)
- Addition of vectors (commutative, associative)
- Scalar multiplication $\exists 0, \forall \alpha \in V, \alpha + 0 = 0.$

$$\forall \alpha \exists ! - \alpha, \alpha + (-\alpha) = 0. \\ (c, \alpha) \mapsto c\alpha, c \in F, \alpha \in V$$

 $1\alpha=\alpha, (c_1c_2)\alpha=c_1(c_2\alpha), c(\alpha+\beta)=c\alpha+c\beta, (c_1+c_2)\alpha=c_1\alpha+c_2\alpha$

Examples

$$F^{n} = \{(x_{1}, \dots, x_{n}) | x_{i} \in F\}$$

$$(x_{1}, \dots, x_{n}) + (y_{1}, \dots, y_{n}) = (x_{1} + y_{1}, \dots, x_{n} + y_{n})$$

$$c(x_{1}, \dots, x_{n}) = (cx_{1}, \dots, cx_{n})$$

• Other laws are easy to show

 $\mathbf{C}^{n}, (Q + \sqrt{2}Q)^{n}, Z_{p}^{n}$ $F^{m \times n} = \{ \{A_{ij}\} \mid A_{ij} \quad F, i = 1, ..., m, j = 1, ..., n \} =$ $F^{mn} = \{ (A_{11}, A_{12}, ..., A_{mn 1}, A_{mn}) \mid A_{ij} \quad F \}$

• This is just written differently

• The space of functions: A a set, F a field

 $\{f: A \to F\}, (f+g)(s) = f(s) + g(s), (cf)(s) = c(f(s))$

- If A is finite, this is just F^{|A|.} Otherwise this is infinite dimensional.
- The space of polynomial functions

 ${f: F → F | f(x) = c_0 + c_1 x + c_2 x^2 + ... + c_n x^n, c_i \in F }$ • The following are different.

$$V = \mathbf{C} = \{x + iy | x, y \in \mathbf{R}\}$$
, $F = \mathbf{R}$
 $V = \mathbf{C}$, $F = \mathbf{C}$
 $V = \mathbf{C}$, $F = \mathbf{Q}$

Subspaces

- V a vector space of a field F. A subspace W of V is a subset W s.t. restricted operations of vector addition, scalar multiplication make W into a vector space.
 - +:WxW -> W, •:FxW -> W.
 - W nonempty subset of V is a vector subspace iff for each pair of vectors a,b in W, and c in F, ca+b is in W. (iff for all a,b in W, c, d in F, ca+db is in W.)

• Example:

$$\mathbf{R}^{n-1} \subset \mathbf{R}^n, \{(x_1, \ldots, x_{n-1}, 0) | x_i \in \mathbf{R}\}$$

- $S_{m \times m} = \{A \in F^{m \times m} | A^t = A\} \subset F^{m \times m}$ is a vector subspace with field F.
- Solution spaces: Given an mxn matrix A

$$W = \{X \in F^n | AX = 0\} \subset F^n$$

 $\forall X,Y \in Wc \in F, A(cX+Y) = cAX + AY = 0. \mapsto cX + Y \in W.$

• The intersection of a collection of vector subspaces is a vector subspace

is not.

$$W=\{(x,y,z)|x=0 ext{ or } y=0\}$$

Span(S) $Span(S) = \{\sum_{i} c_i \alpha_i | \alpha_i \in S, c_i \in F\} \subset V$

 Theorem 3. W= Špan(S) is a vector subspace and is the set of all linear combinations of vectors in S.

• Proof:

,
$$W, C = F,$$

 $= x_{1 - 1} + \dots + x_{m - m}$
 $= y_{1 - 1} + \dots + y_{n - n}$
 $C + = x_{1 - 1} + \dots + x_{m - m} + y_{1 - 1} + \dots + y_{n - n}$

• Sum of subsets $S_1, S_2, ..., S_k$ of V

S₁ + S₂ + ... + S_k = {α₁ + α₂ + ... + α_k | α_i ∈ S_i}
If S_i are all subspaces of V, then the above is a subspace.

• Example: y=x+z subspace:

 $\bar{S}pan((1,1,0),(0,1,1)) = \{c(1,1,0) + d(0,1,1) | c, d \in \mathbf{R}\} = \{(c,c+d,d) | c, d \in \mathbf{R}\}$

 Column space of A: the space of column vectors of A.

Linear independence

• A subset S of V is linearly dependent if

∃α₁,...,α_n ∈ S, c₁,..., c_n ∈ Fnot all 0 s.t. c₁α₁ + ··· + c_nα_n = 0.
A set which is not linearly dependent is called linearly independent: The negation of the above statement

 $\forall \alpha_1, \ldots, \alpha_n \in S$, there are no $c_1, \ldots, c_n \in F$ not all 0 such that $c_1\alpha_1 + \cdots + c_n\alpha_n = 0$.)

 $\forall \alpha_1, \ldots, \alpha_n \in S$, if $c_1\alpha_1 + \cdots + c_n\alpha_n = 0$, then $c_i = 0, i = 1, \ldots, n$

 $(1,1), (0,1), c_1(1,1) + c_2(0,1) = (c_1, c_1 + c_2) = (0,0) \mapsto c_1 = 0, c_2 = 0$

 $c_1(1,1,1) + c_2(2,2,1) + c_3(3,3,2) = 0$ for $c_1 = 1, c_2 = 1, c_3 = -1$.

Basis

- A basis of V is a linearly independent set of vectors in V which spans V.
- Example: Fⁿ the standard basis

 $\epsilon_1 = (1, 0, \dots, 0), \epsilon_2 = (0, 1, \dots, 0), \dots, \epsilon_n = (0, 0, \dots, 1)$

- V is finite dimensional if there is a finite basis. Dimension of V is the number of elements of a basis. (Independent of the choice of basis.)
- A proper subspace W of V has dim W < dim V. (to be proved)

Example: P invertible nxn matrix. $P_1,...,P_n$ columns form a basis of F^{nx_1} .

- Independence: $x_1P_1+...+x_nP_n=0$, PX=0. Thus X=0.
- Span F^{nx_1} : Y in F^{nx_1} . Let X = P⁻¹Y. Then Y = PX. Y= $x_1P_1+...+x_nP_n$.
- Solution space of AX=o. Change to RX=o.

 $egin{array}{rcl} x_{k_1} & & + & \sum_{j=1}^{n-r} C_{1j} u_j & = 0 \ & & x_{k_2} & & + & \sum_{j=1}^{n-r} C_{2j} u_j & = 0 \ & & \ddots & & + & dots & & = dots \ & & x_{k_r} & + & dots & & = dots \ & & x_{k_r} & + & \sum_{j=1}^{n-r} C_{rj} u_j & = 0 \end{array}$

• Basis $E_i u_i = 1$, other $u_k = 0$ and solve above

$$x_{k_i} = -c_{ij}, \mapsto (-c_{1j}, -c_{2j}, \dots, -c_{rj}, 0, .., 1, ..0)$$

• Thus the dimension is n-r:

- Infinite dimensional example:
- V:={ $f| f(x) = c_0 + c_1 x + c_2 x^2 + ... + c_n x^n$ }.
 - Given any finite collection g₁,...,g_n there is a maximum degree k. Then any polynomial of degree larger than k can not be written as a linear combination.

• Theorem 4: V is spanned by $\beta_1, \beta_2, ..., \beta_m$ Then any independent set of vectors in V is finite and number is $\leq m$.

• Proof: To prove, we show every set S with more than m vectors is linearly dependent. Let be elements of S with n > m. $\alpha_1, \alpha_2, \dots, \alpha_n$ $\alpha_j = \sum_{i=1}^{m} A_{ij}\beta_i$

$$\sum_{i=1}^{n} x_{j} \alpha_{j} = \sum_{j=1}^{n} x_{j} \sum_{i=1}^{m} A_{ij} \beta_{i} = \sum_{i=1}^{m} (\sum_{j=1}^{n} A_{ij} x_{j}) \beta_{i}$$

• A is mxn matrix. Theorem 6, Ch 1, we can solve for x₁,x₂,...,x_n not all zero for

$$\sum_{j=1}A_{ij}x_j=0,i=1,\ldots,n$$

• Thus

$$x_1 \alpha_1 + \ldots + x_n \alpha_n = 0$$

 Corollary. V is a finite d.v.s. Any two bases have the same number of elements.

- Proof: B,B' basis. Then $|B'| \le |B|$ and $|B| \le |B'|$.
- This defines dimension.
 - dim Fⁿ=n. dim F^{mxn}=mn.
- Lemma. S a linearly independent subset of V.
 Suppose that b is a vector not in the span of S.
 Then S∪{b} is independent.
 - Proof: $c_1\alpha_1 + \cdots + c_m\alpha_m + kb = 0$. Then k=0. Otherwise b is in the span. Thus, and c_i are all zero.

- Theorem 5. If W is a subspace of V, every linearly independent subset of W is finite and is a part of a basis of W.
- W a subspace of V. dim $W \le \dim V$.
- A set of linearly independent vectors can be extended to a basis.
- A nxn-matrix. Rows (respectively columns) of A are independent iff A is invertible.

(->) Rows of A are independent. Dim Rows A = n. Dim Rows r.r.e R of A = n. R is I -> A is inv.

(<-) A=B.R. for r.r.e form R. B is inv. AB^{-1} is inv. R is inv. R=I. Rows of R are independent. Dim Span R = n. Dim Span A = n. Rows of A are independent.

Theorem 6.

 $\dim (W_1 + W_2) = \dim W_1 + \dim W_2 - \dim W_1 \cap W_2.$

- Proof:
 - $W_1 \cap W_2$ has basis $a_1, ..., a_k$. W_1 has basis $a_1, ..., a_k, b_1, ..., b_m$. W_2 has basis $a_1, ..., a_k, c_1, ..., c_n$.
 - $W_1 + W_2$ is spanned by $a_1, ..., a_k, b_1, ..., b_m, c_1, ..., c_n$.
 - There are also independent.
 - Suppose

$$\sum_{i=1}^{l} x_i a_i + \sum_{j=1}^{m} y_j b_j + \sum_{k=1}^{n} z_k c_k = 0$$

• Then

$$\sum_{k=1}^n z_k c_k = -\sum_{i=1}^l x_i a_i - \sum_{j=1}^m y_j b_j$$

$$\sum_{k=1}^n z_k c_k \in W_1 ext{ and } \in W_2$$

$$\sum_{k=1}^{n} Z_k C_k = \int_{i=1}^{l} d_i a_i$$

• By independence $z_k=0$. $x_i=0, y_j=0$ also.

Coordinates

- Given a vector in a vector space, how does one name it? Think of charting earth.
- If we are given Fⁿ, this is easy? What about others?
- We use ordered basis:
 One can write any vector uniquely

$$\mathcal{B} = \{lpha_1, \dots, lpha_n\}$$

$$\alpha = x_1 \alpha_1 + \dots + x_n \alpha_n$$

Coordinate (nx1)-matrix (n-tuple) of a vector. For standard basis in Fⁿ, coordinate and vector are the same.

- This sets up a one-to-one correspondence between V and Fⁿ.
 - Given a vector, there is unique n-tuple of coordinates.
 - Given an n-tuple of coordinates, there is a unique vector with that coordinates.
 - These are verified by the properties of the notion of bases. (See page 50)

Coordinate change?

- If we choose different basis, what happens to the coordinates?
- Given two bases
 - Write $\mathcal{B} = \{\alpha_1, \dots, \alpha_n\}, \mathcal{B}' = \{\alpha'_1, \dots, \alpha'_n\}$

$$lpha_j' = \sum_{i=1}^n P_{ij} lpha_i$$

$$\begin{array}{lcl} \alpha & = & \sum_{j=1}^{n} x_{j} \alpha_{j} = x_{1} \alpha_{1} + \dots + x_{n} \alpha_{n} \\ & = & \sum_{j=1}^{n} x_{j}' \alpha_{j}' = \sum_{j=1}^{n} x_{j}' \sum_{i=1}^{n} P_{ij} \alpha_{i} \\ & = & \sum_{j=1}^{n} \sum_{i=1}^{n} (P_{ij} x_{j}') \alpha_{i} = \sum_{i=1}^{n} (\sum_{j=1}^{n} P_{ij} x_{j}') \alpha_{i}. \\ & x_{i} & = & \sum_{j=1}^{n} P_{ij} x_{j}' \end{array}$$

• X=0 iff X'=0 Theorem 7,Ch1, P is invertible

• Thus, X = PX', X'=P⁻¹X.

$$[\alpha]_{\mathcal{B}} = P[\alpha]_{\mathcal{B}'}, [\alpha]_{\mathcal{B}'} = P^{-1}[\alpha]_{\mathcal{B}},$$

• Example $\{(1,0),(0,1)\},\{(1,i),(i,1)\}$

- (1,i) = (1,0) + i(0,1)(1,1) = 1(1,0)+(0,1) • (a,b)=a(1,0)+b(1,0): (a,b)_B = (a,D) $P = \begin{pmatrix} 1 & i \\ i & 1 \end{pmatrix}, P^{-1} = \begin{pmatrix} 1/2 & -i/2 \\ -i/2 & 1/2 \end{pmatrix},$
- $(a,b)_{B'} = P^{-1}(a,b) = ((a-ib)/2,(-ia+b)/2).$
- We check that (a-ib)/2x(1,i)+(-ia+b)/2x(i,1)=(a,b).
